

1

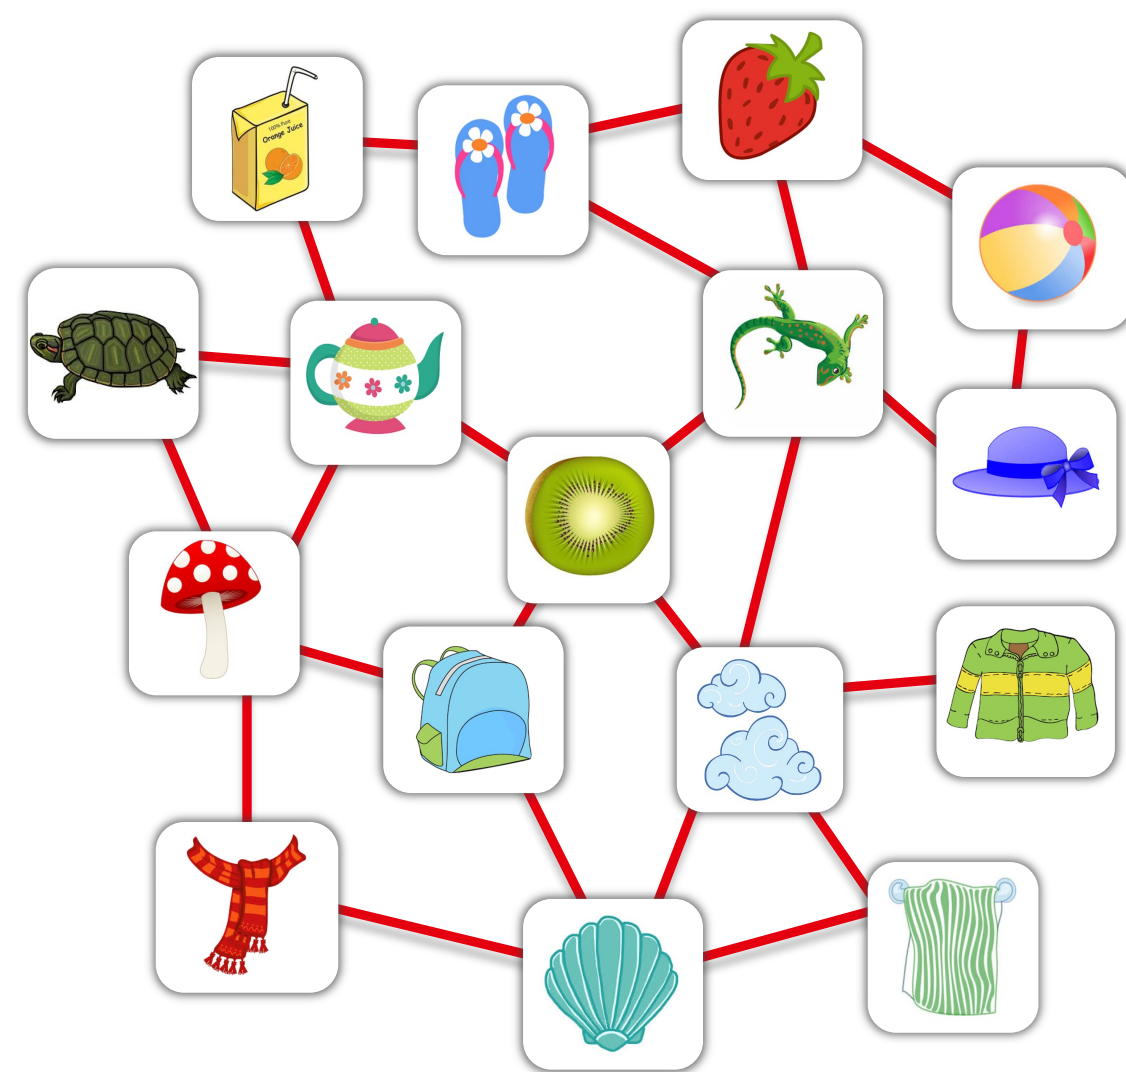

Imagine I have a stack of cards with pictures of random images on them.

2

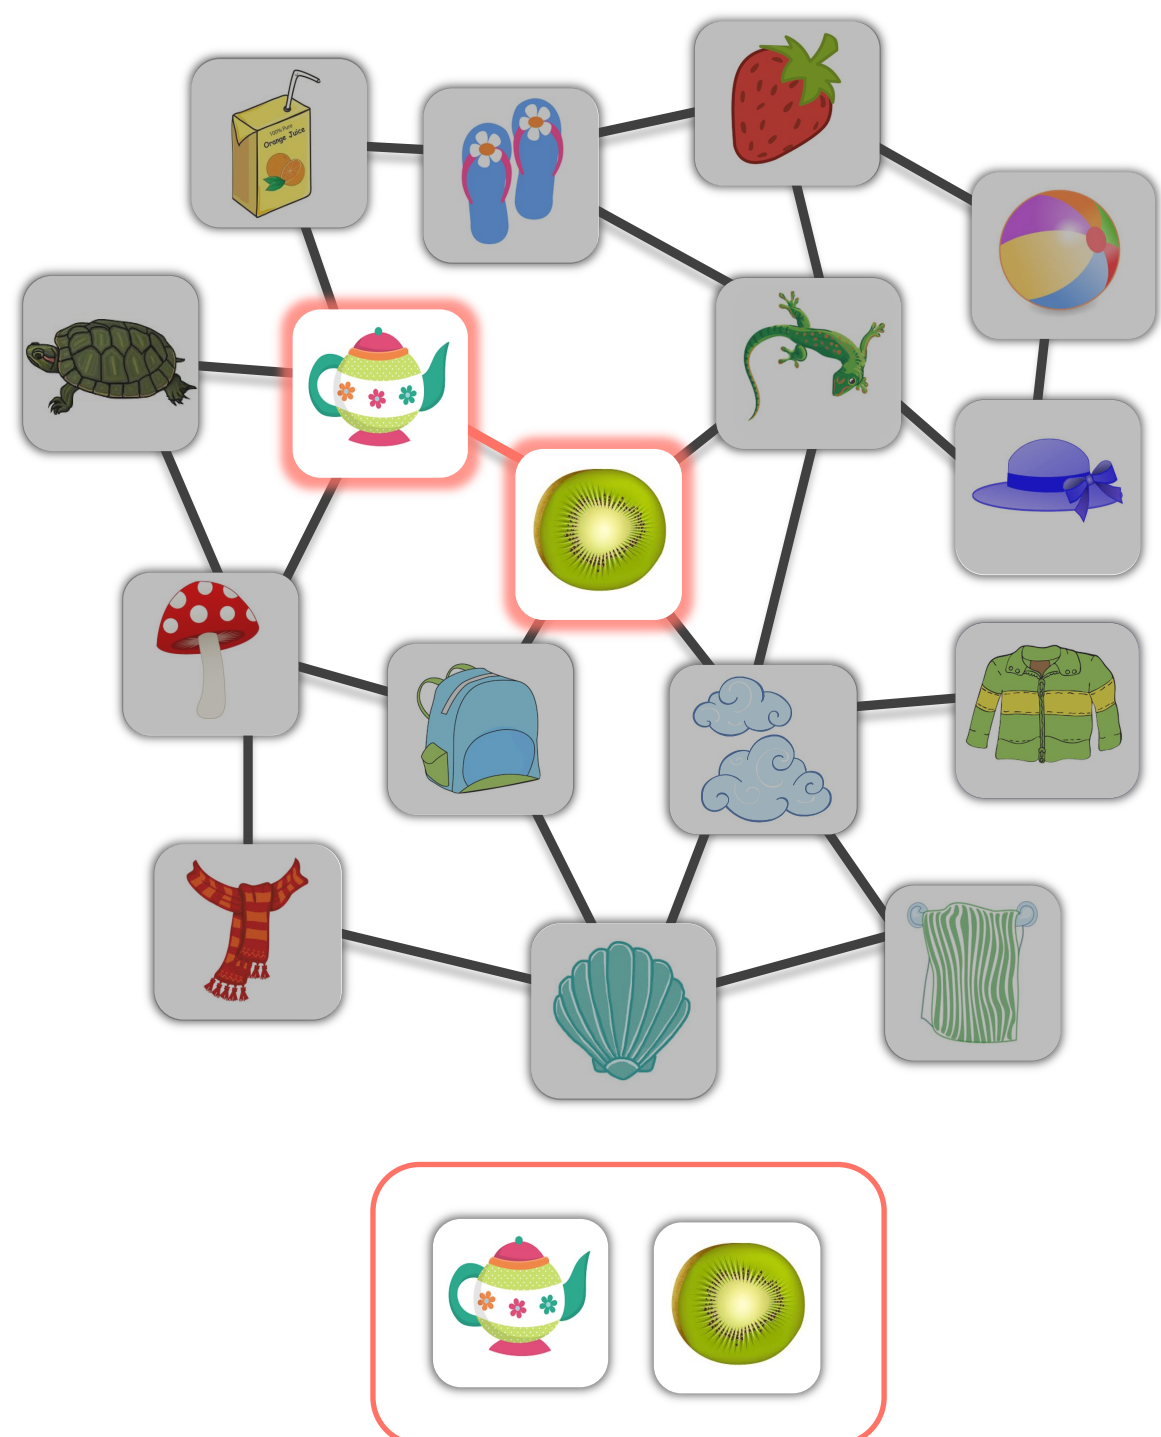

I then trip and scatter the cards randomly across the floor.

3

On the arrangement of cards on the floor, I created a web that connects cards together (as shown in red). Note that the number of neighbors each card has can change from card to card: some cards might be connected to only one another card, while others can be connected to many.

4

I want to describe to you the arrangement of cards on the ground, but I do not allow you to look at the arrangement. Instead, I only allow you to observe two cards that are immediate neighbors of each other, connected by the web. For example, I would share with you a pair of cards, a kiwi and a teacup, indicating that they are neighboring each other on the web.

During this learning session, I will only share two cards at a time.

An example of your screen while playing “Which is Closer”:

Which is Closer?

Card 1

Card 2

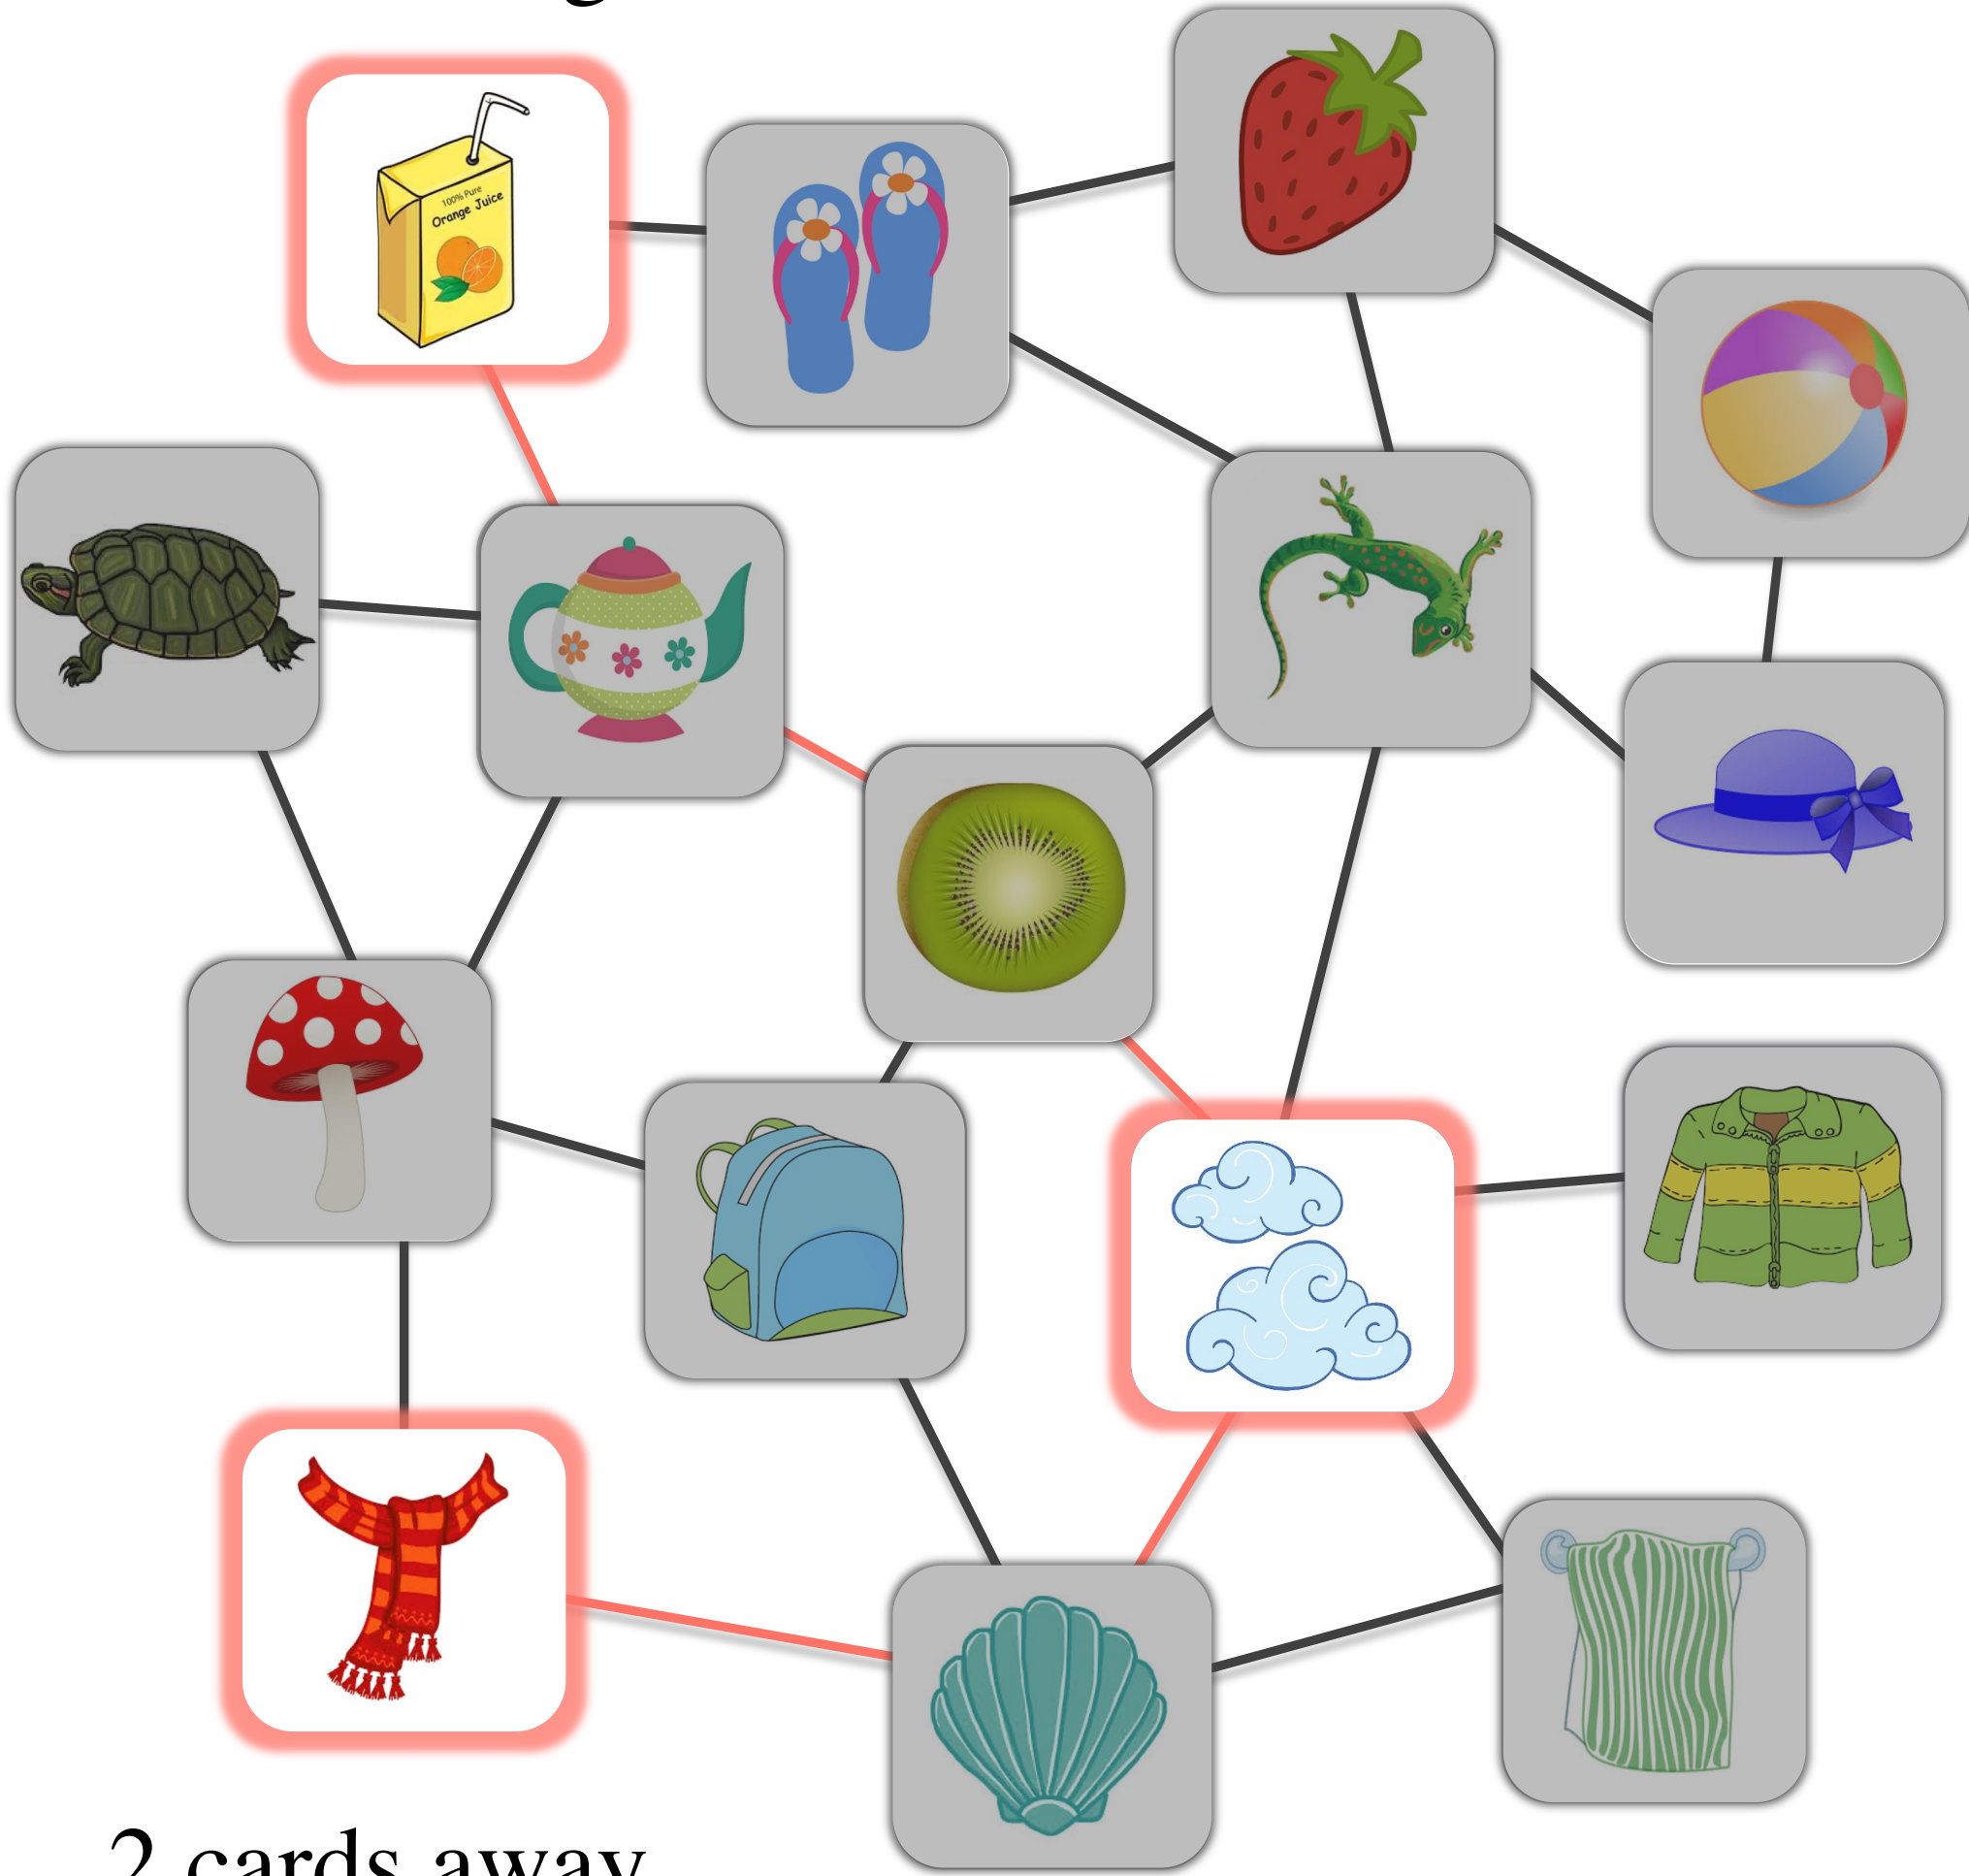

Your target card is:

In this example question of “Is it Closer” I am asking you if the cloud card is closer to “Card 1”, the juice box, or “Card 2”, the scarf.

3 cards away from target

2 cards away from target

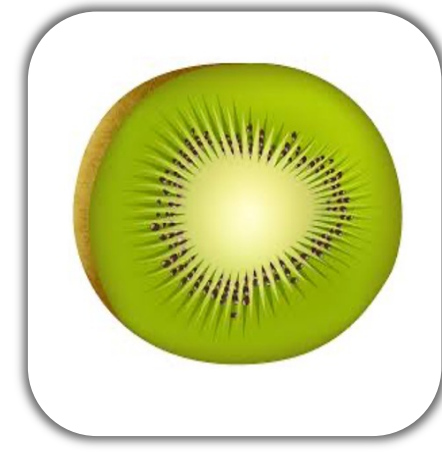

In this example, the correct answer is the scarf card. This is because you can reach the scarf card from the cloud card in at least two cards, whereas the juice box card is reached in at least three cards.

An example of your screen while playing “Navigation”:

Navigation

Your current card:

Number steps to target is: 2

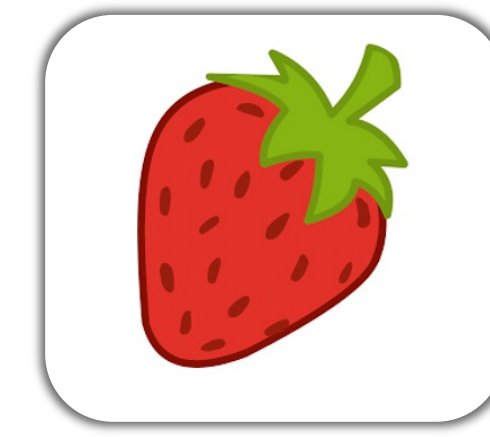

Card 1

Neither

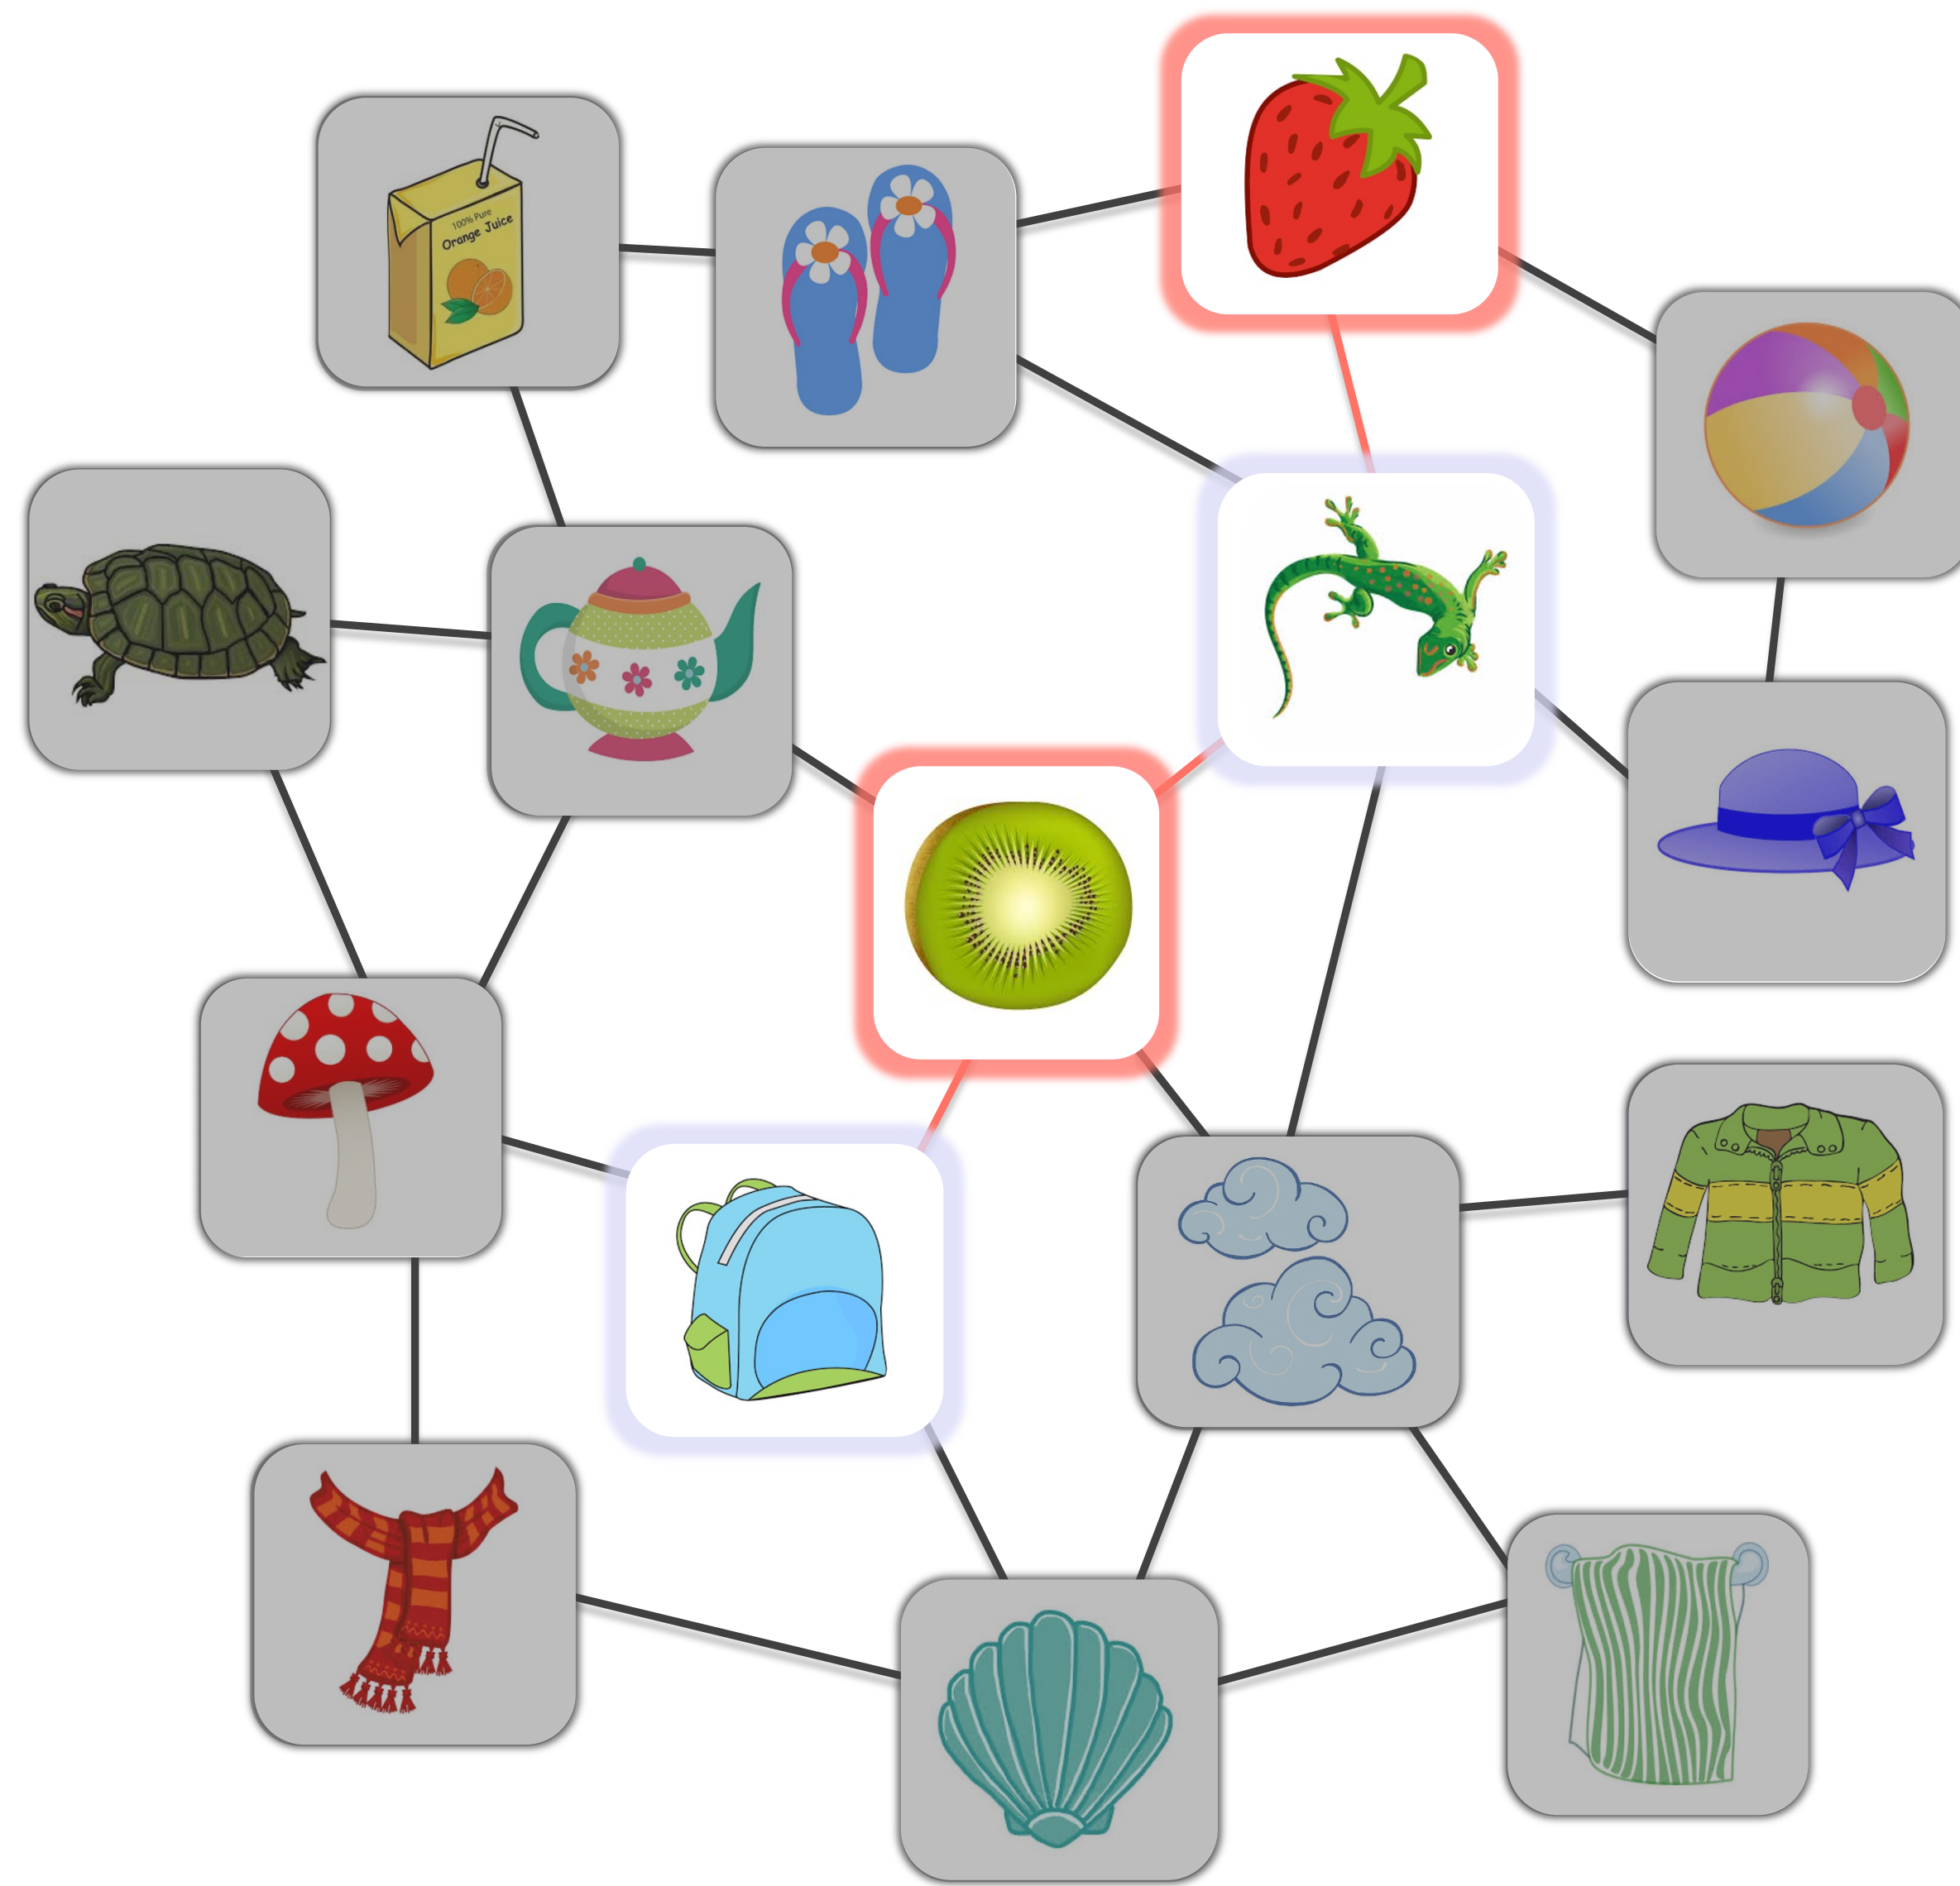

Your target card:

Card 2

In this example question of “Navigation” you have to reach the target card, the strawberry card, from your current card, the kiwi card. To do this, you must choose between card 1, card 2, or neither.

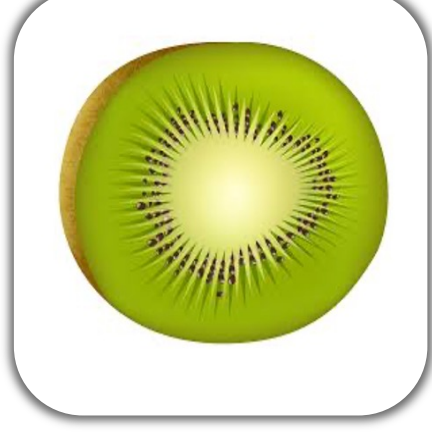

In this example, the correct answer is the salamander card. This is because by choosing the salamander card, you are now 1 card away from the target card, the strawberry card, rather than 3 cards away from the strawberry card if you had chosen the backpack card.

An example of your screen while playing “Navigation”:

Navigation

Your current card:
Number steps to target is: 2

Card 1

Card 2

Neither

Your target card:

In this example question of “Navigation” you have to reach the target card, the strawberry card, from your current card, the kiwi card. To do this, you must choose between card 1, card 2, or neither.
